Table of contents

Install and read in R packages needed	1
Read in the demo data	1
Example basic table	2
Customize the table's appearance	2
Customize the table's appearance II	2
Code Available	2
Code to produce the example basic table	2
Code to produce the customized table I	6
Code to produce the customized table II	9

Install and read in R packages needed

```
library(NHANES)
library(gtsummary)
library(gt)
library(dplyr)
library(purrr)
```

Read in the demo data

```
data <- NHANES::NHANES
```

Example basic table

Customize the table's appearance

- Move the total column to the far-right end of the table for improved readability.
- Remove the 'N = xxxx' from the header to streamline the table's appearance.
- Add a "Total (denominator)" row at the top of the table for better context and clarity.
- Avoid decimal places for both numbers and percentages for a cleaner presentation.
- Include additional summary statistics for continuous variables, such as mean (SD), median (IQR), and range, to provide a more comprehensive summary.
- Customize the footnotes

Customize the table's appearance II

- Separate the Number and Percentage Columns: Split the n (count) and p (percentage) values into two separate columns in the table.
- Right-align the Number and Percentage Columns: Apply cell_text(align = "right") to these columns.
- Label the Columns as n and col%
- Add Colors: Apply cell_fill() for background colors and/or cell_text() for text colors to enhance readability.

Code Available

Code to produce the example basic table

```
data %>%
    # Remove missing data in the Diabetes variable for simplicity
    filter(!is.na(Diabetes)) %>%
    # Select relevant variables
    select(Gender, Age, AgeDecade, Race1, BMI_WHO, Education, MaritalStatus, HHIncome, Work,
    # Create a summary table by Diabetes group
    tbl_summary(
        by = Diabetes,
        statistic = list(
```
